Complex scattering objects

ABSTRACT

The *T*-matrix method is one of the most versatile and efficient direct computer solvers of the macroscopic Maxwell equations and is widely used for the computation of electromagnetic scattering by single and composite particles, discrete random media, and particles in the vicinity of an interface separating two half-spaces with different refractive indices. This paper is the seventh update to the comprehensive thematic database of peer-reviewed *T*-matrix publications initiated by us in 2004 and includes relevant publications that have appeared since 2013. It also lists a number of earlier publications overlooked previously.

Published by Elsevier Ltd.

1. Introduction

The thematic database of *T*-matrix publications was initiated in 2004 [1] and has been followed by six updates [2–7]. This seventh update lists and classifies 211 new publications [8–218]. The majority of the new entries have appeared since 2014 with the exception of a few older publications omitted inadvertently in [1–7]. The current update is compiled by applying the same four general criteria:

- The database includes only publications dealing with the scattering of macroscopic time-harmonic electromagnetic fields.

- In general, publications on scattering by isolated infinite cylinders and systems of parallel infinite cylinders in unbounded space are excluded.
- Publications on the Lorenz–Mie theory and its various extensions to individual isotropic spherically symmetric scatterers are not covered.
- The database contains only references to books, peer-reviewed book chapters, and peer-reviewed journal papers, while conference abstracts as well as Masters, PhD, and Habilitation dissertations are not covered.

Furthermore, we continue to use the same operational definition of the *T*-matrix method, i.e.,

In the framework of the *T*-matrix method, the incident and scattered time-harmonic electric field vectors are expanded in series of suitable vector spherical wave functions; the relation between the columns of the respective expansion coefficients is established by

means of a transition matrix (or T matrix). This concept applies to the entire scatterer or to separate parts of a composite scatterer.

As such, this definition encompasses what is often referred to as the multi-sphere method or the generalized Lorenz–Mie theory.

As before, the inclusion of a publication in our database does not constitute any formal endorsement or quality certification on our part. However, the practical value of this database is enhanced by classifying all references into a set of narrower subject categories. Note that a reference can appear in several subject categories.

As always, we would very much appreciate e-mailing us missing T -matrix publications as well as information on new books, book chapters, and peer-reviewed journal papers for inclusion in a forthcoming update of this reference database.

2. Particles in infinite homogeneous space

2.1. Books, reviews, tutorials, and databases
